Soy - Processed

Product Code: ESSOYPRD-48

For the detection of Soy Protein Residues in Food Products and Environmental samples.

Intended Use
The ELISA SYSTEMS Soy Protein Residue assay is an enzyme-linked immunosorbent assay (ELISA) that may be used to screen food products for the presence of soy protein material. Samples that have been subjected to prolonged high temperature and pressure treatments (such as in canning operations), hydrolysis or fermentation, may not be suitable for analysis using this test kit. Please discuss with your ELISA SYSTEMS representative regarding the suitability of this kit for these samples.

Background:
Although the incidence of allergy to soybean proteins is quite low in comparison with other major food proteins, the gradually increasing consumption of soybean products makes the identification and characterization of major soy allergens a focus of investigation.

The major allergens of soybean have not been as well characterized as peanut allergens, however, two soy proteins have been identified as antigenic. Soy Trypsin Inhibitor and other soy proteins were chosen as the soy protein indicators for this assay.

Interpretation of Results:
This assay is based on comparison to Soy Flour Protein Concentrations.

Please note: A special extraction solution is required for samples containing Polyphenols, including Dark Chocolate, Wine, Fruit Juices, Herbs, and Tannins. (Product code: ESADDSOL)

Controls Supplied
0, 2.5, 5.0, 10.0 and 25.0 ppm (mg/kg) Soy Flour Protein.

Why test for Food Allergens?
✓ Brand Name Protection
✓ Prevent Costly Product Recalls
✓ Ensure Consumer Confidence
✓ Duty of Care
✓ Comply with Product Labelling Requirements.

Allergens may occur unintentionally in foods for several reasons including:
Cross-contamination of ingredients
Food preparation errors
Improper cleaning of equipment

Kits available:
Almond, Buckwheat, Beta-Lactoglobulin, Casein, Crustacean, Egg, Gliadin, Hazelnut, Lupin, Mustard, Peanut, Sesame, Soy

How the ELISA SYSTEMS Soy Protein Residue test works:

Step 1
Sample is added

The test sample is added and if Soy residue is present, it will bind to the specific antibodies.

Step 2
Antigen-Antibody Complex

Enzyme labelled conjugate is added and binds to the captured Soy residue to form a “Sandwich”.

Step 3
Coloured End-Point

TMB Substrate is added, which is converted in the presence of the Enzyme conjugate to form a blue colour if Soy residue is present in the sample.
A yellow colour is formed once Acid is added to stop the reaction.

Total test time is approximately 80 minutes on extracted samples. (Incubation times of 30, 30 and 15 minutes each.)
Food Allergen Residue ELISA Protocol

Add 100 microlitres of Standards and Samples to their allocated Antibody-coated wells. Mix all wells for 10 seconds by gentle shaking on a flat surface. **Incubate for 30 minutes.**

Add 100 microlitres of the Green Conjugate Solution to each well. Mix all wells for 10 seconds by gentle shaking on a flat surface. **Incubate for 30 minutes.**

Add 100 microlitres of the Substrate Solution to each well. Mix all wells for 10 seconds by gentle shaking on a flat surface. **Incubate for 15 minutes.**

Add 100 microlitres of the Stop Solution to each well. Mix all wells for 10 seconds by gentle shaking on a flat surface.

Read results visually, comparing with the colour of the Standards. The results can be read on a microplate/strip reader. Results must be read within 30 minutes.

**Interpretation of Results**
Interpretation is based on the suggested extraction/dilution protocol. Results are for screening purposes. All results should be interpreted as part of a HACCP plan for Food Allergens. Any sample returning a positive result should be regarded as a presumptive result and confirmation or further testing should be performed.
